

Great Salt Lake salinity, north arm vs. south arm

Discrete water samples at each arm's USGS gauge, 1998–2022. The causeway cuts the north arm (Gunnison Bay) off from river inflow, so it sits near salt saturation year-round, while the south arm (Gilbert Bay), which receives the Bear, Weber, and Jordan Rivers, runs 2–3× less saline.

Source: USGS National Water Information System / Water Quality Portal, sites 10010100 (north arm) and 10010000 (south arm).
